

## Sidewall Return Drag Conveyor

The Sidewall Return Drag Conveyor is the most revolutionary design since the invention of paddle type drag conveyors. Conventional drags return the empty paddles on slide rails or over return idler sprockets. Sidney's new design reshapes the U-trough to allow the paddles to return on the sidewalls of the trough. This simple but unique design also makes the paddles captive which prevents lift or torsional twisting of the paddles. Intermediate discharge gates are totally self-cleaning since the paddles drag flush against the closed gate.

This SWR conveyor was introduced in May of 1997 and already we have many repeat customers with one particular pet food manufacturer using over 60 of these conveyors in one plant.

Capacities range from 1900 CFH to 24,000 CFH.
